Our Tree Surgery Department

Tree Surgery, as practiced by responsible parties, is not a racket and does not consist of miraculous cures and secret processes as many are led to believe, but is a series of common-sense methods perfected by a study of trees and their growths and habits and used in their care and preservation. If you value a tree, get an experienced tree surgeon to do the necessary work on it. An inexperienced laborer will often only succeed in further damaging the tree. We maintain a staff of expert tree men with a knowledge of Pruning, Cavity work, Cabling and Bracing, Fertilizing, Spraying and the general care of trees.

Purpose of Pruning. To keep all dead, broken and diseased limbs cut out. To keep trees within bounds. To keep small trees shaped up every year or two. Keep all cuts painted with waterproof tree compound.

Purpose of Surgery Work on Cavities. Decay enters at old cuts, wounds, frost cracks, etc. It does not take it long to spread over a wide area and eat deep into the tree. The longer the cavity is neglected the more it will cost to fix it, if it has not gone so long it is impossible to fix. The tree surgeon removes all the decayed and diseased wood, disinfects, brace and fills the cavity. The decay is stopped and the wound will start healing over.

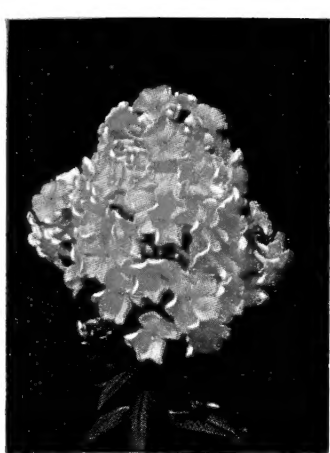

Purpose of Cabling and Bracing. "An ounce of prevention is worth a pound of cure." Cabling and bracing will strengthen the tree with bad crotches, or long overhanging limbs. The wind and snow and ice will not then break and split off large limbs that will spoil the shape of the tree for all time. If a split is not too bad it can be drawn back into place and by properly bracing, the tree will be as good as new and strong or possibly stronger than before.

Fertilizing. More and more do we realize the importance of feeding trees, especially those trees which have to withstand city conditions. A healthy vigorous tree is not as susceptible to attacks of insects and disease, and abler to resist if attacked. Feed your trees every two years; it will pay.

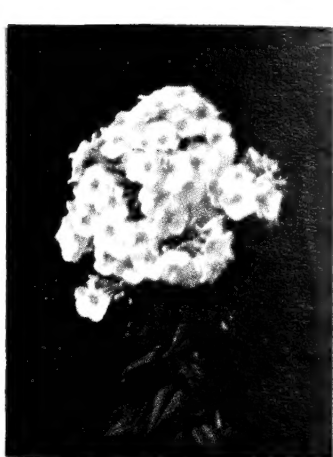

Spraying. Dormant spraying will control scale insects and kill the eggs of some of the other pests. Summer spraying is necessary to control some of the eating insects and the leaf and twig blights. Make sure that whoever sprays your trees has a knowledge of trees, insects and spray materials. Otherwise the wrong spray may be used and have no effect on the insect or disease and again the trees may be seriously damaged as some spray materials will kill certain varieties of trees. We have equipment to take care of your spraying jobs quickly and thoroughly.

OUR EXPERIENCED MEN WILL SOLVE YOUR TREE PROBLEMS AT REASONABLE COST. GENERAL CARE OF YOUR TREES UNDER OUR SUPERVISION WILL INSURE THEIR SAFETY AND CONTINUED HEALTH.
